

Wired Remote Start for Honda Pre-Bluetooth EU7000is Installation and User Guide

made by Genconnex®

How to use Wired Remote

Starter Button

Press and release to start the generator after you have pressed in the On/Off button. You will know the generator started by seeing the On/Off button light up.

If the generator fails to start, check first that the On/Off button is pressed in (not flush with surface) then check generator display for error code. Note that when mode), the display on the front of the generator should be also lit or blinking .

On/Off button

Press in once to 'wake up' the generator before starting. Press again to put the generator back in 'sleep mode' and turn the output power off if the generator was running.

Note that when you first press in this button to wake up the generator, the blue light around the center will not turn on until after you press the starter button and the generator has started. This button will light up blue until you press this button again to TURN OFF the generator output and put the generator back in 'sleep mode'.

How to install your Wired Remote

Tools needed: pliers and medium size flat head screwdriver
Est. time for install: 5 min.

Step 1

Open battery compartment on the front lower left corner when facing generator

Step 2

Remove black plug from white connect located near the top of the compartment

Step 3

Insert new wired remote connector into 8 pin white connector

Step 4

Remove tab from cover to route wired remote cable out of compartment

Step 5

Re-install cover over battery compartment with wired start cable access

Step 6

Turn and leave key in ON position to enable wired start function
